Technical Field The present invention relates to an ink jet printing apparatus. 2. Related Art Ink jet printing apparatuses have been widely used, in which droplets of ink are ejected from nozzles at a nozzle surface of a printing head to thereby perform printing on a printing medium. The printing head is controlled by an electrical signal to move in a predetermined direction. As one of such printing apparatuses, for example, there is a printing apparatus of the type in which ink is supplied from a carriage onto a printing medium in a state where the carriage moves and the carriage is moved integrally with a carriage driving motor. In addition, there is also known a technique for changing, while the carriage moves, an angle of inclination of an ink supply portion of the carriage with respect to a direction perpendicular to a direction in which the carriage is moved. In the printing apparatus described in JP-A-2010-85395, ink supply (wiping) is performed when a printing apparatus is in a standby state, and the ink supply is stopped when a printing operation is performed. This apparatus is configured to prevent the ink from being mixed with each other in a nozzle portion to thereby prevent 5b5f913d15
