It has been known that most of the various pharmaceutical compositions contain lipases as a constituent of their active principles. It has been found by the present inventors that a member of a class of medicinal agents designated as "lipase inhibitors" comprises specific, structurally novel imidazole derivatives, which are effective in inhibiting the action of lipases. More specifically, it has been found that when a specific imidazole derivative is administered in conjunction with a lipase inhibitor, the lipase inhibitor is more effective in inhibiting the action of the lipase than when administered alone. Accordingly, it is the object of this invention to provide a novel lipase inhibitor. It is another object of this invention to provide a novel method for inhibiting the action of lipases. These and other objects of the invention will readily become apparent to those skilled in the art from the following detailed description.Sponsored Content Searches Related to a1d647c40b
