Bigfish Games - Magic .Q: What are the situations in which fundamental groups of aspherical manifolds are finite? In the context of characterizations of manifolds without boundary, the following result has been frequently stated: If M^n is an aspherical manifold, then the fundamental group of M is finite. Question: What are the situations in which this is not true, and how can we get around this? A: A starting point is the following theorem. Theorem Let M^n be an aspherical manifold. Let $X = \mathbb{R}^n \setminus \{0\}$ be the corresponding n -dimensional real space. There is a fibration $p: X \rightarrow \mathbb{R}P^{n-1}$ of the aspherical manifold X by homotopy spheres into the n -dimensional real projective space. The fibers of p are acyclic n -manifolds (actually, the union of k copies of $S^k \times S^{n-k-1}$ with a point added to each boundary component). Now, there is also a theorem of Serre that says that fundamental groups of manifolds which are finitely dominated with respect to a given cover are finite. (And conversely, if Γ is a finite group then Γ can be included in a finite cover $p: X \rightarrow \mathbb{R}P^{n-1}$ such that X is finitely dominated with respect to

The identification of leukemia pathologic subtypes is an important first step in the diagnosis and treatment of leukemia. The aim of this study was to analyze apoptosis-related genes, BCL2L13, BCL2L14, and BCL2L18, for their ability to differentiate between acute lymphoblastic leukemia (ALL) and acute myeloid leukemia (AML). A total of 119 adult patients with acute leukemia (44 ALL and 75 AML patients) were enrolled in this study. The

expressions of BCL2L13, BCL2L14, and BCL2L18 were determined by reverse transcriptase-polymerase chain reaction.

The data were analyzed using multivariate analysis for the prediction of the pathologic subtypes. The mean expressions of BCL2L13, BCL2L14, and BCL2L18 in the ALL and AML groups were 0.55 ± 0.64 and 1.23 ± 0.84 ($P=0.003$), 0.92 ± 0.83 and 1.48 ± 0.90 ($P=0.004$), and 0.93 ± 0.92 and 1.85 ± 1.51 ($P=0.002$), respectively. The area under the receiver-operating characteristics curve (AUC) for the diagnosis of AML was 0.776 for BCL2L13 (95% confidence interval [CI], 0.680-0.863), 0.684 for BCL2L14 (95% CI, 0.576-0.797), and 0.828 for BCL2L18 (95% CI, 0.727-0.926). The results revealed that BCL2L13, BCL2L14, and BCL2L18 play a vital role in the differentiation of ALL and AM 3e33713323
