For people with a sweet tooth, sweet science is definitely at the forefront of their minds. So, when I read this article in the July 2011 issue of All About Children magazine, I wanted to share it. The article, published in the latest edition of National Geographic Kids magazine, is written by Christopher Abba for the magazine's Sweet Success series. Abba considers the sweet science of salt when visiting Antarctica. "Salty ice is one of the most interesting and well-documented miracles in science," he writes. "The atoms within salt crystals have tiny hooks that bind to tiny hooks of ice crystals, and together they form the familiar white crystals that we know so well." The article is the seventh in the Sweet Success series,

What's New In SolarWinds VM To Cloud Calculator?

SolarWinds Cloud Calculator enables you to simplify the process of estimating cloud prices for private clouds. It converts your on-premises workloads to cloud-based equivalents with a service, physical or virtual machine-by-machine comparison. Its prices are based on publicly available information about these workloads' virtualization platform, service and operating characteristics. Cloud Calculator features included: 1. Cloud service comparison: You can convert your existing private cloud-based systems into a public cloud service with a service-by-service comparison, showing the highest cost performing option and the lowest cost

performing option. 2. Cost analysis: You can easily analyze the costs of converting your private cloud to a cloud service by using the income and expense wheel. Our software shows the costs for the highest-earning services and the lowest-cost services for each source of revenue. 3. Virtual machine conversion: You can perform an audit of your entire on-premises virtual estate and migrate your workloads to a public cloud service using a machine-by-machine comparison. Our software can also audit your workloads to migrate them from your current public cloud service to another service. 4. Time and workload conversion: You can convert your workloads' time of use to the same time of use on a public cloud service.

1. Technical Field The present invention relates to a resist composition and a method for forming a resist pattern.

2. Description of Related Art In the semiconductor industry, fine circuit patterns are formed by a photolithography technique using a photoresist composition. In general, chemical amplification photoresist compositions containing a polymer having acidic functional groups or deprotecting groups and an acid generator as

a principal constituent have been widely used as the photoresist composition. Recently, a technique has been developed in which a thiol compound is added to the resist composition to minimize the change in resistance value after dry etching (see, e.g., U.S. Pat. No. 5,030,577). This technique has now been applied in practice. Unfortunately, when the amount of thiol compound added to a photoresist composition is increased to achieve a positive tone, the sensitivity of the photoresist composition decreases. In addition, the sensitivity of a negative tone resist composition is reduced and the resist pattern formed by the photoresist composition is not normally patterned as intended. Accordingly, there remains a need for a resist composition having improved sensitivity and
