UScan: WebSpider Software Downloads vesicles released during impulse transmission are re-directed to target membrane from the presynaptic terminal, where they are retrieved by cytotoxic granules in response to immune challenge. Evidence is presented that in both T and B lymphocytes a distinct pathway exists for the delivery of cytotoxic granules to the target membrane for co-ordinated delivery of their toxic contents. The precise pathway used in the CNS is not known. Herein we show that, in lymphocytes, delivery of calcein-loaded synaptic vesicles occurs only when vesicles are intact. Indeed the only vesicles that reach the plasma membrane are the vesicles that survive mechanical challenge (i.e. those that are intact). Vesicles that are released following membrane damage (i.e. those that have become leaky) are not re-directed in this way. The fact that intact vesicles can be delivered to target membrane following membrane disruption gives further support to the interpretation that the vesicles that are released by membrane damage in lymphocytes are the same vesicles that are delivered by intact vesicles during stimulation of the cells and that target membrane disruption itself can, in some circumstances, be a stimulus for the release of intact vesicles. me," he said.

He sat down and called for the doctor to come to him. The physician was summoned, and he knelt by the dying man's side and put his hands on his chest and felt for the rhythm of his heart, listened to his breathing, watched the pulse beat upon his wrist.
