New Implementation of IEnumerable is here. The new IEnumerable class is written with the intention of being faster than the original implementation. It uses a subset of the same algorithms as the built in IEnumerable, but uses new code to achieve an incredible performance boost, while still being a little bit backward compatible with the original IEnumerable. public class IEnumerableWithExtensions : IEnumerable Hi, you're trying to use an enum as a switch parameter in a VB.NET project. The IDE complains that the string "myenum" is not available. The problem is that

this string is available at compile time, but not at run time. To avoid the IDE's problem, remove the string from the enumeration and use the following syntax. Sub Main() Dim f As New System.Windows.Forms.OpenFileDialog Dim myenum As New System.Enum("myenum") Try Select Case myenum Case myenum.First, myenum.Second, myenum.Third, myenum.Fourth Case Else MsgBox("Hi") End Select Catch MsgBox("Error") End Try End Sub The CodeProject.com review is at The CodeProject.com review is for version 0.3.0. Add any key value to a NTFS Alternate Data Stream. Attributes include name, title, category, keywords, etc. The original data can also be included. After adding metadata, an ID must be assigned to it in the format, X Metadata ID The Metadata ID is a unique identifier for the metadata value. This ID is a 16 character unicode string that is case sensitive. The Metadata ID will be assigned automatically when metadata value is modified. The Metadata ID allows to identify the

corresponding metadata value in the database. NOTE: the Metadata ID is the same as a GUID in database and we need to be careful when use it. Supported File Formats: Metadata can be added to multiple file formats. So, the metadata values will be persisted across NTFS files as long as the file extension is the same or a character that can be read by Metadata Control. These file extensions are: 1) Text file (.txt), ASCII encoding, Unicode Transformation Format (UTF-8) 2) HTML file (.html) 3) Image files (.jpg,.bmp,.gif,.png) 4) Rich Text Format (.rtf) 5) Windows Media (.wmv,.avi,.mov) 6) Office Word 2007 (.doc,.docx) 7) Office Excel 2007 (.xls,.xlsx) Supported OS: This control works on any OS. The

Metadata ID is assigned to the corresponding metadata value on Windows XP, Windows Vista, Windows 7, Windows 8, Windows 10, Windows Server 2003, Windows Server 2008, Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2. NOTE: The Metadata ID is assigned only if the NTFS file system is writable. Metadata ID is not assigned on directories and files that are read-only. Supported Views: Metadata ID will be persisted on all views of NTFS file system. This allows metadata to be persisted across the file system even if the file is re-arranged, renamed or deleted. Supported System: This control supports ASP.NET 4.0 application. NTFS file system on all

Windows versions and file system types. Supported Languages: This control allows to read and write metadata value as string in any encoding: UTF-8, UTF-16, UTF-32, ANSI, ASCII, ISO-8859-1. The Metadata ID will be in the same encoding as the metadata value. Supported Encodings: The metadata value is stored at NTFS Alternate Data Streams. The metadata will be persisted in the same encoding as the file. To modify metadata as a string, we need to set the correct encoding when we read and write metadata value. Supported Met
