Category:Autodesk Category:AutoCADQ: Double output in VBA and Excel I'm having trouble debugging a VBA function that is spitting out 2 values in excel when I only asked for 1  
Function Step(ByVal c2 As String, ByVal c3 As String) Step = Application.WorksheetFunction.VLookup(c2, Range(rng), c3, vbxlLookupMatch) End Function  
If i put step into debug, it just writes to the function step cell "step" twice. Is there a way to remove this output or clear the excel input cell before the call? A: You can use the Application.Volatile Property.

This will stop VBA from using the Application.WorksheetFunction object. Try the following instead: Function Step(ByVal c2 As String, ByVal c3 As String) Step = Application.WorksheetFunction.VLookup(c2, Range(rng), c3, vbxlLookupMatch) End Function  
When you say debug you mean that you want to actually see the output? If so, you want to look at the immediate window: Use the Debug>Windows>Immediate Window to execute commands or for the Immediate window to be active in the IDE. Update: Since you want to see the output in the cell you

are calling the function from then you can use the  
Debug.Print Command. When you press F8 it will show the  
Output in the Immediate window. Update2: I ca3bfb1094

### **What's New In AutoCAD?**

**New Common Blocks: Line, Angular, and Circular** Combine three common sketch types in one tool. Choose any of the three options — line, angular, or circular — and create any angle shape that you want, as many times as you want. With the new filter panel, you can choose the desired type from a list of up to 12 options. For example, you can specify that only circles or arcs should be created.

**App-Specific Project Files:** Enable file extensions to define the type of project. Choose File → New. Enter a name for the project. When you open the project, it automatically applies the extension to the current active drawing, ensuring that your project is ready to use.

**Smart Connect:** Browse for the file you want to open. A new or saved drawing opens directly from a folder or

---

directory. You don't need to remember the name or location of the file. Data Management: Transformations: Automatically save and restore the changes you make to any drawing without using autoSave or autosaveMax. The tool finds all objects in a drawing with the same name and format as the active drawing, and automatically applies the formatting settings to the objects. A better way to view and print drawings: Enable Bookmarks to navigate a drawing. You can now use the print toolbar to navigate around your drawing, and you can print individual pages of a drawing. Drawing Tools: Smarter Snap: Snap to a point, line, curve, circle, arc, or other shape. You no longer need to select points and lines with the shortcut key. Select the nearest point on a shape: Snap to the nearest point on any object. Now you can select a point on an object that lies on a path, and you can select a point that lies on a line. Data Tools: New batch operation tools: Elements: Add new drawing components, such as text boxes, dimensions, arrows, and line segments. Dimensional Editing: Ribbon bar commands for precision editing: Ribbon Command: If a dimension is off by more than 1/32 inch, you can reposition it automatically. Select the dimension, then choose Reset. Ribbon Command:
