

$v(1) = \dots = v(\lambda) = 0$ for $v \in V$ and $\lambda \in \beta$. Is it possible to find an upper bound d on the dimension of $V(\beta)$? I know that the vector space $V(\beta)$ is always a finite-dimensional vector space, since it can be defined by a quotient of the semigroup algebra $\mathbb{C}[\mathbb{N}_0^{\Lambda}]$. So if we have an upper bound, it is the highest dimension of the finite-dimensional vector spaces in this family of vector spaces. But I wonder whether there is another way to find an upper bound, that does not use this finiteness. If we have a finite dimensional K -vector space V and a finite semigroup S , what is an upper bound on the dimension of the subspace of the semigroup algebra $\mathbb{C}[S]$ that is generated by the elements $s \cdot s^{-1}$ with $s \in S$? A: The rank of a semigroup algebra is the maximal cardinality of a set of pairwise non-proportional homogeneous idempotents. This was established by Kuroda in his paper 'Note on a class of semigroup algebras I'. The semigroup algebra is the \mathbb{C} -algebra with underlying vector space the
