----- MammothCopy is an easy to use, Java based tool designed to help you copy big or many files from one computer on the Internet, directly to another. This could also be possible with tools like WinSCP and a SSH server, but those are too complex for normal users. MammothCopy is geared towards parents wanting to send photos to their kids, professionals that want to transfer huge files. MammothCopy user interface is very simple. The program launches a very small web browser window displaying a log-in page. The page shows the login page on the left, and a menu on the right. The login page looks like this: ----- User Name: Email Address: Clicking the "Login" button makes you enter the information that is shown on the page. The program then builds the login data into a URL and downloads the page that shows the file content. After logging in the user has to browse to the place where the file to be downloaded is located. After the browser window is refreshed the user is presented with a list of file names. The user then simply selects the file name, and click the "Download" button. The file can then be copied directly to a computer. MammothCopy is a Java based program. Java is used on a large number of websites. Q: C# Multithreaded Chat Client OK, so I am doing some research on chat clients (I am new to C#) and the only examples that are available are threaded servers on each end (client and server) and then they use socket-level communication. However, I would like to do the following: Have multiple clients connected at

MammothCopy With Serial Key
