Don't let the verb "Photoshop" scare you—it should be no more intimidating than other professional programs, such as Adobe Illustrator, CorelDRAW, and ArtFX. It is a powerful, powerful program. Photoshop's features and type of editing Photoshop's features can be divided into four broad types of editing or manipulation: Editing color: Colors and tones are important for photos and graphics. Color is everything. Without color, there are no pictures, no graphics, and no photos. Photoshop offers ways to correct, manipulate, enhance, and adjust color. Creating and manipulating: A Photoshop image is usually some type of graphic, or photo. Creating and manipulating these images is the bulk of Photoshop work. Image composition: Adobe Photoshop was designed with two main uses in mind: image creation and composition. With all the different features, tools, and ways to manipulate images, you need to decide which you need to do. Retouching: This is the final step in Photoshop. Photographers often don't need to retouch photos, but for other types of work, retouching may be needed. And it is a huge job. When retouching, most types of work are involved: darkening a person's eyes to make them look more intense, blurring the background so that a person's form is clearer, and making colors richer or more intense with a touch of skill. The following sections help you figure out which Photoshop type to use. Editing color The many features Photoshop offers for editing color include: Color correction: In the basic section of Photoshop, you can correct color for the entire picture, like a color wheel. Effects: Photoshop has many built-in effects that you can apply to photos and graphics, such as blurring or softening. Color styles: Photoshop offers many color styles to choose from for photos or graphics. These are preset color styles with predefined colors. Adjustments: With the Adjustments panel, you can adjust brightness, contrast, sharpness, saturation, white balance, and other editing features. Color histogram: The Color Histogram works in a way similar to the traditional one in Figure 10-1. This tool enables you to see the tonal distribution of the image — how much of the image is in each of the color ranges. In Figure 10-1, the blue-on-green range is much larger than the red

How to use I like both Photoshop and Photoshop Elements so I decided to show you how to use both. I will be talking about the Elements version, but most of the steps are basically the same. I am assuming you already know how to use Photoshop and you might find some of these steps easier, not harder, to follow than for Elements, which is based on Windows. If you are someone who edits photos on your cellphone or a pro who edits on an Apple computer, you might find it easier to use a photo editor for iPhone or iPad instead of Photoshop. Elements doesn't come with the app so you would have to buy Photoshop for iPhone or Elements for iPad or you could use other photo editing apps on the App Store. Step 1: Opening a file In both, the opened file will be stored inside a new window, by default. You can either use the traditional Windows button to open it in the first window, double-click or press ctrl + n. You can also double click to open the image. If you are on a Mac, open a file using the command-n method (1 for macOS) Either way, you should see the file opened in your default application. If not, change the application (default is Photoshop) Step 2: Undo, redo You can use the keyboard shortcuts ctrl + z, ctrl + y, and ctrl + shift + z to undo, redo, and cut in Photoshop. There is a shortcut for the image in Elements ctrl + delete Step 3: Edit tools To edit an image in Photoshop you first select the tool, and than use the tool and your fingers (or a mouse). In Elements you can either select the tool or use the keyboard shortcut. In this case, I chose ctrl + Z. Step 4: Editing features There are many options for editing in Photoshop, some more useful than others. Here is a list of the ones I use. The original file and the file after the editing have different file extensions (psd and psdx) and most clients don't care, but if you are concerned about that, you can change the original to the new file after you edit it. In Photoshop, most of the editing is done with layers. Layers contain background color, text, you can add shadows, you can transform, rotate, crop 388ed7b0c7

Q: How to give the number of hours to an event in cakephp I have an event table in cakephp. I want to get all events in that month (range) Below is my code and I want to give the event hours and date format('m'); $month = substr($month, 0, -2); $number = count($event->where(['date' => ['>=', $now->format('m'), $now->format('d')]])); $start = new DateTime(); $start = $now->addMonth(); $period = new DatePeriod(

Q: Unable to use read.csv I tried to load this in R: and I keep getting this error: Error in file(filename, "rb", encoding = encoding) : cannot open the connection when I do this (on the same link): library(readr) read_csv("15.txt") I get an empty dataset. I also tried read_csv("15.txt") but it also returns an empty dataset. A: Using the url from @yihui and the code you posted: library(readr) read_csv("") This returns a 536k x 8 dataset. There is a lot of misinformation about infectious diseases and HIV/AIDS out there. Without adequate information, it is very difficult for people to make informed decisions about their own health and well-being. This is especially true when it comes to HIV/AIDS. If there are not accurate, objective scientific facts and data about HIV/AIDS available, people can misinform themselves on the topic and, based on misinformed opinion, make self-destructive, potentially harmful decisions. The misinformation and fear from those opposed to the AIDS epidemic can be heard all across the country, including the medical community. The myth that HIV is a "gay disease" and that "there's nothing you can do to prevent AIDS, just live with it" has changed very little over the past 30 years. And the myth that HIV and AIDS are all but a death sentence, that it will kill you within a few years no matter what you do, is very similar to how many people believed that smoking causes cancer and that there was nothing you can do to stop smoking. What are the facts about HIV/AIDS? According to the Centers for Disease Control, today: HIV is the leading cause of death for people ages 25 to 34. HIV is the second leading cause of death among African Americans. In the past ten years, AIDS is responsible for more deaths than all the wars since the second world war ("Global AIDS Pandemic" – CDC). According to the World
