You can use it to draw widgets that contain text or images. Widget authors can easily include Burd displayers in their own widgets by inheriting from a Burd "displayer" subclass. Burd is a simple object-oriented graphics library. It is similar to

Sage, although it is less capable. Burd is implemented in C++, and makes heavy use of the Smalltalk language concept of objects and classes. For example, you can write your own objects just as easily as you can write your own displayers. For more information, see the documentation, at the module home. Also, browse the example programs.

Effect of calcium ions on the interaction between myosin, actin, and heavy meromyosin.

The effect of calcium ions on the interaction between myosin, actin, and heavy meromyosin was investigated by measuring the cosedimentation of myosin and actin and the light-scattering signal of heavy meromyosin. In the absence of Ca^{2+} , the apparent sedimentation coefficient for the free heavy meromyosin (Δs) was 2.03 S, and the half-maximal concentration of heavy meromyosin was 0.7 μM . In the presence of Ca^{2+} , Δs was increased to 2.34 S and 0.5 μM . The effect of a high concentration of Ca^{2+} (1.5 mM) on the

interaction was even more striking: Δs was increased to 3.16 S and 1.0 μM , and a new light scattering signal was observed in the presence of calcium. Addition of these values of Δs to the Stokes radius of free heavy meromyosin yielded values of approximately 10 nm for the diameter of the myosin-actin-heavy meromyosin complex and approximately 14 nm for that of the myosin-heavy meromyosin complex. These values are similar to the previously determined radii of the free myosin-actin-heavy
