\* Adobe provides a useful online tutorial site at [www.photoshopforbeginners.com](http://www.photoshopforbeginners.com). \* Photoshop's document recovery features can be invaluable to the photographer. Images can often be brought back from the brink by creating alternate versions of the image and then using the feature's Undo capability. If you only use Photoshop for white-balancing your digital negatives for printing, you can use its Save As command to create a copy of an image that is saved with the same settings, including tonal range and recovery. \* If you plan on editing images that have been scanned or taken with a digital camera, the Scanner and Camera Control plug-in can be used for specifying custom settings for the scanner and camera. To create a plug-in, visit Adobe's website (or search online for information on creating plug-ins). \* Photoshop contains numerous useful filters for color and tonal corrections as well as for tweaking an image's overall look. The Filter→Blur→Motion Blur tool automatically applies a Gaussian blur and enables the user to move the amount of blur, amount of motion, and distance from the original subject. With the Picture → Adjust Color Curves tool, the user can adjust a range of colors in a particular region or the entire image, depending on its size.

## **Layer Styles** Layer styles, which are a combination of appearance properties, such as color, opacity, and stroke width, can be used to modify the appearance of a layer. Layer styles can also be used to create effects such as vignettes, lens flares, and drop shadows. You can create your own layer styles with a picture-editing program. You can quickly access the Layer Styles panel by choosing Window > Layers; see Figure 14-4. The panel is divided into several sections. In this figure, only the Adjustments section is visible, showing the settings that we have already changed. Figure 14-4. The Layer Styles panel. The Tool Options section is where you can create your own styles or change the style used by a tool. Figure 14-5 shows the Tool Options dialog box for the Brush tool. Figure 14-5. The Tool Options panel, where you can create or modify a brush's settings. The Brush section of the Layer Styles panel allows you to change a brush's effect (Size, Shading, and so on). The Vignette settings contain four sections: Shadow, Light, Invert, and Inner Glow. You can customize the settings to create vignettes, which are a technique that blurs the inner edges of an image to add depth and increase its overall contrast, and Reduce Noise, which is used to create soft, subtle vignettes. You can also set a brush to have a stroke, which can be a solid color, pattern, or gradient. The Stroke Width setting affects the size of the stroke. The Size setting also affects the size of the brush. You can change the Size of the Brush and Size of Stroke settings to influence the appearance of your brush and stroke sizes. You can find more controls for creating effects using Layer Styles in the Camera Raw section of the Color menu. One feature that is not available on Windows is the tool-separation feature found on Mac OS X. This feature allows you to create and use independent layers of type, shapes, and fills, by applying different brushes and blending modes to each layer. You can then composite the layers to create new objects. To use this feature, you must first

Q: Keras/Sequential, drop connection I have a model with 2 layers, 1st is made of 4 convolutions, and the second of two fully connected layers. The problem is that the first convolution will launch the second in two different conditions. When the incoming data is the same as the previous one, the second convolution won't need to launch the second. But when the data is different from the previous, the second one will need to launch. Now I tried to make the second convolution drop the connection between them if the data is different, but it doesn't seem to work. If I do that, then the second convolution won't run at all, since there is no data to process. Here is the code I have: #First Layer: conv\_1 = conv2d(18, 32, kernel\_size=(3,3), strides=(2,2), padding='same', activation='relu') pool\_1 = max\_pool\_2x2(conv\_1) conv\_2 = conv2d(32, 64, kernel\_size=(3,3), strides=(1,1), padding='same', activation='relu') pool\_2 = max\_pool\_2x2(conv\_2) conv\_3 = conv2d(64, 128, kernel\_size=(3,3), strides=(1,1), padding='same', activation='relu') pool\_3 = max\_pool\_2x2(conv\_3) conv\_4 = conv2d(128, 128, kernel\_size=(3,3), strides=(1,1), padding='same', activation='relu') pool\_4 = max\_pool\_2x2(conv\_4) #Second Layer conv\_5 = conv2d(128, 256, kernel\_size=(3,3), strides=(1,1), padding='same', activation='relu') conv\_6 = conv2d(256, 512, kernel\_size=(3,3), strides=(1,1), padding='same', activation='relu') conv\_7 = conv2d(512, 512, kernel\_size=(3,3), strides=(1,1), padding='same', activation='relu') conv\_8 = conv2d(512, 1024, kernel\_size=(
