But it wasn't because of the 23,000-plus engineers who graduated from its six-year Bachelor of Technology course this year. Instead, it was the team of scientists from the institute, led by professor Urvashi Sahni, who brought home the first-ever prize for research in nanotechnology. Sahni had come up with the idea of biocompatible nanoparticles in 1999, when she was teaching at the Indian Institute of Technology, Bombay. It was not the first time her team had worked on the concept - they had won the prize for their work on diclofenac drug delivery a couple of years ago. And it wouldn't be the last. Scientists across the country have been pushing the envelope to come up with revolutionary applications of nanotechnology, which involves using materials in the nanoscale size range - 100 nanometres (0.1 micron) or less. Nanoparticles can be used to break down the molecular structure of existing medicines, or to develop new drugs from scratch. They can be infused into the body through a syringe, or injected into a specific area of the body, creating a targeted drug delivery system. Some of these nanoparticles can even form into nanotubes or nanowires that can carry messages through the body. It has been a relatively young field of ca3bfb1094

I have tried the following: SimpleDateFormat sdf = new SimpleDateFormat("MMM dd, yyyy"); Date d = new Date(); System.out.println(sdf.format(d)); The output is: Mar 10, 2018 A: try this : SimpleDateFormat sdf = new SimpleDateFormat("MMM dd, yyyy"); sdf.setLenient(false); sdf.setTimeZone(TimeZone.getTimeZone("GMT")); System.out.println(sdf.format(d)); And here is the output : 07/10/2018 07:00 AM To get the exact time you can format the Time object like this : sdf.format(new Date(d.getTime())); Q: C++ sorting: string arrays and constant array should be at the end of the sort A function has to sort two arrays. First one is the string array and the second one is a constant array. The constant array is as big as the string array. Each element of the string array is a random capital letter. The constants array has all the same values that letters in the string array plus the name of the object that contains that letter. This means that the string array may contain values in any order and the constant array will always be the same. So the idea is to sort the string array alphabetically and for each alphabet in the string array have a constant array containing the names of the objects that contain that alphabet. The
