Q: Type deduction for function template parameters What is the correct way to do function template type deduction? Is it by the number of template parameters (ie. for 2 functions, where f(x, y) and g(x, y, z) are both valid, f(x, y) should be deduced to be the same type as g) or by the number of template arguments? I am asking because I have seen both, as well as cases where it works and cases where it doesn't. For example: template void f(A x, B y, C z); template void g(A x, B y, C z, D w); // Type deduction is valid for g (5 args) but invalid for f (3 args) // This is not valid type deduction, but works when the first template argument is unused f(10, 20, 30); // Same type as g // This also works f(10, 20, 30); A: The usual way is to pick one way and stick with it. You can combine the arguments into a single tuple type and use that for the type parameters: template void g(A x, B y, C z, D w, E); template

Get the benefits of a hot-key (Ctrl+S) for sending drawings to production, and new hot-keys (Ctrl+C+S) for merging color scheme objects and drawing on top of existing drawings. Draw, send, and merge on the fly using the new AutoCAD. Rapidly send and incorporate feedback into your designs. Import feedback from printed paper or PDFs and add changes to your drawings automatically, without additional drawing steps. (video: 1:15 min.) AutoCAD 2023 automatically processes colored guidelines and overhangs, giving you clean, consistent output that you can tweak. You can also colorize grid lines for more consistency. Create drawings with a reduced number of drawing steps. Drawing enhancements: Drafting Features: Viewport Tag features: Create, organize and manage custom viewport tags to easily identify views and views within views. Easily organize views based on its parent view using tag groups. Draw on one view, then jump to another view in the drawing to continue drawing on the same view. Organize custom tags to viewports that can't be listed in the Tag dialog, using Viewport Tag Explorer. Update objects in viewports with tags so you can maintain tag consistency and control when updates are made. Edit and reposition viewports quickly and easily without any drawing steps. Overviews and Navigation Features: Model Space: Master model space overviews show all the views in the drawing. They can also be arranged to show views by topological order and are easy to navigate. Draw views directly on top of each other with a feature called "Cascade" and easily move views to different layers and groups. Compatible with the Standard, Extensible Application Markup Language (SAAML), and Network Graphics file formats. Hierarchy Editing: Hierarchy feature enables you to easily and quickly navigate the drawing hierarchy in model space. Save customized hierarchy settings and save views as different named hierarchies. Save and Load Tools: The Load Command tool lets you download and view 3D models from the Internet. It also provides information about the selected 3D model, such as the origin of the 3D model, as well as access to 3D printing services. The Save and Load tool lets you save your model and associated customization settings. Your model
