Code V Optical Design Crack

To provide a more general cracking technique, a model and a computer simulation of the optical systems of a designer, where the optical geometric objects are represented by polygons. He can then break the film by controlling the writing laser and choosing an area of the film to target. The optical data of the optical system is read into the computer and the crack rate is input into the program and the crack rate is compared against the crack rate input from the user and the program calculates a cracking rate for a given thickness of film. This creates a uniform nonuniform film with a large crack (high cracking rate) in the middle. The results are shown graphically.
